Gain total control with touchscreen!

Scenario: *Television broadcast station*

A TV station was using analog VTR format cassette tapes to store its media, but with digital media becoming increasingly common, the station wanted to convert its entire library of stored content to HD format. To do so, they decided to use Sony's transfer solution that combined specialized hardware and GUI software. They calculated that it would take 12 complete transfer systems to manage the thousands of VTR cassettes to be processed. Since each transfer system used multiple computers to provide the necessary computational power, the station required a solution to centrally manage the 12 systems and all the attached computers.

Benefits

- The KL3116T is the ideal solution for GUI-based software that needs to be implemented across multiple systems, but do not require mouse/keyboard inputs.

- Instead of transferring VTR cassettes one at a time, the TV station can have thousands of cassette tapes processed at once saving time, effort and cost.

- Without redundant peripherals, the KL3116T solution does not take up a lot of space.
